Micromotors are a class of miniaturized motors which operate in liquids. They are constructed with such small dimensions that they can be considered micron-size in operation. Unlike the more familiar high power miniature motors which can be used in a wide variety of applications, micromotors are specifically designed to operate in liquids. The liquid in which micromotors operate is typically a water-based electrolyte such as an aqueous solution or a molten salt. Micromotors, as with most miniature motors, can be classified as either rotary or linear. Rotary micromotors are typically constructed with a rotor affixed to an outside cavity of a stator or case such that rotation of the rotor through the cavity causes a movement of the liquid or electrolyte. Linear micromotors are also typically constructed with a stator and a rotor but in a configuration such that movement of the stator through the rotor causes a movement of the liquid or electrolyte. All micromotors have some means for generating electrostatic forces between the stator and rotor to drive the movement. Micromotors can also be classified as direct current or alternating current operation. For certain applications, it would be beneficial to know the physical dimensions of a micromotor, such as its rotor diameter and length. If the rotor is excessively small or too large in physical dimensions, it may be difficult to operate reliably in the liquid medium. For linear micromotors, rotational speed of the rotor is a function of the mechanical balance of the rotor. Thus, it is desirable to make the rotor as small as possible to maximize the linear length of the stator. Of course, if the diameter of the rotor is excessively small, it may not be possible to produce a reliable linear movement of the stator relative to the rotor.Jefferson Secondary School (Trenton, Ontario) Jefferson Secondary School is a secondary school in Trenton, Ontario.
